- Inventory Status (Published, Reserved, Sold, Archived, or Active / Draft
- Photos
- Date Added / Listed

Shopify Integration

- Listing Sync
 - Sync approved listings to Shopify
 - Sync listing/status updates
- Catalog Synchronization
 - Keep item information updated between the system and Shopify
- Sales Synchronization
 - When an item is marked Sold within our system (in-store sale), the system automatically updates the corresponding Shopify product's status and removes/archives it from all sales channels, so it can never be listed as available in two places at once.
 - *[Supabase database (our system's database) will be the authoritative record for everything (consignment lifecycle, authentication, item history, consignor info), and our system will push the relevant fields to Shopify via API whenever something changes (new listing published, price changed, marked sold). This is our planned course of action to have a "one source of truth via sync" to eliminate redundancy in manual inputs to both Shopify and our system.]*

Client Assignment Management

- Client / Consignor List
